

Gate 2 — second review of NGA_shadow (Nigeria)

An independent vendor (openai/gpt-5.6-terra) attacked the first pass on the **36 rows** where being wrong costs the most: the twelve prerequisites, every ratification hold and every recorded gap. It planned its own searches from the construct and never saw the first pass's sources while searching; it saw the recorded row only when forming its verdict. Its proposals entered through the same gates as any other evidence.

\$5.99 across 604 vendor calls in 11 minutes.

What it changed

outcome	rows	
filled	4	a gap or withheld level replaced by evidence that cleared every gate
withdrawn	0	a level removed: the cited source was shown not to support it
relevelled	1	the level changed: a second reading of better evidence, cleared through every gate
adjusted	3	substance and level stand, provenance corrected
upheld	28	the row survived the attack

Verdicts as the reviewer gave them

verdict	rows
confirmed	24
adjust	7
refuted	5

A reviewer verdict is not the same thing as a change to the row. A refutation that proposes evidence still has to clear quote verification, the tier rule, the construct rule and — on a prerequisite — the T1–T3 bar, exactly as the first pass did. Where the two columns disagree, the gates are why.

Rows Gate 2 filled

Evidence the first pass did not reach, which then cleared every gate. This is the measure of what a second independent search buys.

3.11 Agricultural data interoperability standards · prerequisite · severity high

- The first pass cites a Federal Ministry press release for a compound claim about the status of a NITDA standard and an agricultural governance framework, but that cited page was not supplied for quote verification. The independently supplied primary NITDA document affirmatively shows that the issued standard is for public-sector interoperability, not agriculture. Treating the agriculture-related registry architecture work as an agricultural interoperability standard would be a construct expansion; under the name as written, the evidence supports the explicit Absent rung rather than a withheld/Announced classification.
- now: Documented at level 1, T3 — National Information Technology Development Agency (NITDA) — Data Interoperability Standards, 2016
- <https://nitda.gov.ng/wp-content/uploads/2020/11/DATA-INTEROPERABILITY-STANDARDS11.pdf>

4.9 Inter-ministerial coordination mechanism · prerequisite · severity high

- The first-pass Gap is affirmatively contradicted by the official State House report of an inaugurated Nigerian Interministerial Committee on Research and Innovation. The report gives the committee a coordination role across five strategic sectors and expressly includes Agriculture and Climate Resilience; it therefore supports an Adopted mechanism under the indicator name as written.
- now: Documented at level 3, T3 — The State House, Abuja — VP Shettima Inaugurates Interministerial Committee On Research, Innovation
- <https://statehouse.gov.ng/vp-shettima-inaugurates-interministerial-committee-on-research-innovation/>

6.12 Digital public goods adopted · hold · severity high

- The first pass's withholding applies an additional requirement—verified registration or deployment inventory—that is not in the indicator name. The official FMCIDE announcement explicitly records Nigeria's commitment to integrate DPGs into government digital services. This supports an Announced rung, while its language about developing a playbook and planned nominations prevents Adopted or Operating.
- now: Documented at level 2, T3 — Federal Ministry of Communications, Innovation & Digital Economy (Nigeria), Nigeria Joins the Digital Public Goods Alliance
- <https://fmcide.gov.ng/nigeria-joins-the-digital-public-goods-alliance/>

8.1 Prevalence of undernourishment (%) · gap · severity high

- The first-pass conclusion that no Nigeria-specific PoU value was available is contradicted by the supplied World Bank T1 indicator page, which reports Nigeria's most recent value as 20 in 2023.
- now: Measured at level 2, T1 — World Bank Data — Prevalence of undernourishment (% of population) - Nigeria
- <https://data.worldbank.org/indicator/SN.ITK.DEFC.ZS?locations=NG>

Levels Gate 2 changed

The row kept its evidence and changed its level, on a proposal that cleared quote verification, the construct rule, the prerequisite bar and the requirement to carry a negative finding. Read the ones that went UP first — raising a level is the direction that claims readiness.

3.3 National farmer registry · prerequisite · severity high

- The first-pass Adopted/level-3 classification is not sustained by the independently supplied official evidence. The nearest directly relevant Ministry evidence documents a stakeholder workshop and planned registry features, while later Ministry material says the country needs a credible national farmer registry. This supports Announced, not Adopted.
- now: Documented at level 2, T3 — Federal Ministry of Agriculture and Food Security, Nigeria Launches National Digital Farmers Registry to Strengthen Food Security
- <https://agriculture.gov.ng/nigeria-launches-national-digital-farmers-registry-to-strengthen-food-security/>

Provenance Gate 2 corrected

The substance and the level survived; the source, tier or vintage did not.

4.1 Data protection/privacy law · prerequisite · severity low

- The first-pass substantive conclusion and level survive review, but the supplied primary Official Gazette is stronger and directly quote-verifies enactment and the law’s data-protection purpose. The cited GAID document was not among the retrieved quote-verifiable pages; the row should therefore be recorded against the Official Gazette, with the NDPC resource page used only as supporting evidence of operational administration.

4.2 Cybersecurity framework (ITU GCI) · gap · severity high

- The first-pass Gap finding is too strong: an ITU T1 page explicitly states that Nigeria is among tier-3 countries in GCI 2024. The page still does not provide a numerical GCI score or tier-to-threshold crosswalk, so the threshold level remains withheld.

5.5 Digital extension capability · prerequisite · severity medium

- The first pass withheld Operating because it lacked evidence that a digital-extension unit was delivering services. A newer, directly relevant T3 federal-ministry release affirmatively reports that NEEP has been launched and says farmers and stakeholders “will now have access” to real-time agricultural information through an interactive platform. This supports Operating rather than merely a documented institutional unit, although the mechanically derived level remains 3 because no quality or actual-scale evidence is available.

Reading this

Gate 2 is scoped to the rows the first pass was least sure of, so a high upheld count is not a null result — it is the first pass’s abstentions being confirmed as real by an independent searcher, which is exactly what makes a recorded gap trustworthy. The figure that decides whether Gate 2 earns its share of the budget is **filled** plus **withdrawn**: rows where a second opinion changed what the assessment says.
