

Shadow run against the verified assessment — Egypt

EGY_shadow_g2 compared row by row with EGY_v17, the verified assessment. The verified assessment was not read by the pipeline and has not been modified by this comparison.

The five questions

- 1. How many of the 57 rows land on the same level? 24 of 57 (42%).** Of the 26 rows where both assessments set a level at all, 15 agree exactly (58%) and 24 are within one level (92%).
- 2. Do all twelve prerequisites match? 5 of 12** carry the same status. The divergences are listed below; each one moves at least one column of the readiness matrix.
- 3. Gaps.** The verified assessment records 5 (2.1, 5.12, 6.3, 6.13, 8.17). The shadow run records 20, of which it found 5 of the recorded ones and raised 15 the verified assessment does not carry. It also set 10 ratification holds against the verified assessment's 5.
- 4. The rural/national trap at 2.1. Avoided.** The shadow run recorded 2.1 as Gap with no level; gate verdict gap. It did not record a national coverage figure against an indicator naming rural coverage — the error that passed an assessor gate and an initial peer review before an audit caught it.

This country's verified assessment records 2.1 as Gap at no level, so the two agree.

On the construct: *The indicator names RURAL mobile broadband coverage. The best available Egypt-specific evidence in the retrieved pages is NATIONAL: ITU's Digital Development Dashboard for Egypt reports population covered by at least a 3G mobile network (2022) = 100% and at least a 4G mobile network (2022) = 98%. These are total-population figures with no urban/rural split. The only rural-disaggregated Egyptian f...*

Recorded value: DATA GAP – 1) ITU Statistics landing page – confirms ITU publishes population covered by mobile-broadband network 'total and by urban/rural area', but only as global/regional/development-group aggregates, not per-country. 2) ITU DataHub home and About pages – confirm the World Telecommunication Ind...

- 5. Cost and time. \$21.88** across 1651 vendor calls in 38 minutes, against a \$500 country ceiling — 4.4% of it, across 2 passes (EGY_shadow, EGY_shadow_g2). By vendor: anthropic \$11.57, perplexity \$3.70, openai \$3.70, exa \$1.94, jina \$0.97.

Pillars

pillar	verified mean (band)	rated/held	shadow mean (band)	rated/held
A1	3.0 (Established)	8/2	3.6 (Advanced)	5/2
C1	3.8 (Advanced)	5/0	4.0 (Advanced)	4/0
C2	2.88 (Established)	8/0	3.33 (Established)	3/3
C3	3.25 (Established)	8/0	3.4 (Advanced)	5/1
C4	3.33 (Established)	3/3	3.0 (Established)	3/0
E1	3.11 (Established)	9/0	2.5 (Emerging)	4/4
O1	2.67 (Established)	6/0	2.0 (Emerging)	3/0

Which direction the divergences run

This is the part to read first. A shadow run that withholds a level where the verified assessment set one costs coverage; a shadow run that sets a level *higher* than the verified assessment is claiming readiness the evidence may not carry, and that is the failure that matters.

- **2 rows read higher** than the verified assessment.

- **2.11 Device financing/subsidy schemes** — L1 to L3. Egypt’s Ministry of Communications and Information Technology operates ProGIG, a joint initiative of the National Telecommunication Institute and Nasser Social Bank offering soft loans of up to EGP 6...
- **7.12 Responsible-AI safeguards (consent, rights)** — L1 to L3. Egypt adopted a cross-sector Egyptian Charter for Responsible AI, launched by the National Council for Artificial Intelligence in April 2023, built on five values (Human-Centeredness, Transparency an...
- **9 rows read lower.** 2.5 (L5 → L4), 3.6 (L4 → L3), 3.7 (L4 → L3), 4.6 (L4 → L3), 4.9 (L4 → L3), 5.5 (L4 → L3), 3.9 (L4 → L3), 3.10 (L4 → L3), 8.4 (L2 → L1)
- **21 rows withheld a level** the verified assessment set: 1.5, 1.6, 1.7, 2.7, 3.3, 3.4, 3.5, 3.8, 3.11, 4.4, 4.5, 4.7, 5.8, 6.4, 6.9, 6.12, 6.14, 7.2, 8.9, 8.11, 8.12.
- **1 row set a level** the verified assessment withheld: 5.7.

The asymmetry between the last two is the abstention threshold, stated as a number. It is the figure to tune, and tuning it in either direction moves the first bullet — which is the one that decides whether a machine-set readiness matrix can be trusted.

Where the shadow run withheld a level

Each gate below is a design decision doing its job. A row that reaches a gate keeps its evidence; what it loses is the level, and with it its place in every mean.

gate	rows
construct (hold)	9
tier (hold)	2

Independent corroboration

11 rows are also covered by a machine-fetchable T1 series, fetched separately and never substituted for the research lane’s own answer. **7 of 11** research values agree with the independent series within 2%.

Reading this

Divergence here is the expected result. The verified assessments came from sustained human-directed searching under the full tiered protocol — Nigeria went from 21 recorded gaps to 4 that way — and this pass runs once, on a budget, without the Gate 2 refutation round that found four of those gap refutations. More gaps and more holds are the honest output of a first automated pass, not a regression.

The number to act on is the **abstention rate**: 10 holds and 20 gaps against the verified 5 and 5. Too loose and everything reads Ready; too tight and everything reads Unverified. These figures are what that threshold should be tuned against, and they should be kept — when automated Gate 2 arrives, re-running this comparison is what tells you whether it earns its 15% of the budget.
