

Shadow run against the verified assessment — Nigeria

NGA_shadow_g2 compared row by row with NGA_v17, the verified assessment. The verified assessment was not read by the pipeline and has not been modified by this comparison.

The five questions

- 1. How many of the 57 rows land on the same level? 30 of 57 (53%).** Of the 27 rows where both assessments set a level at all, 20 agree exactly (74%) and 25 are within one level (93%).
- 2. Do all twelve prerequisites match? 5 of 12** carry the same status. The divergences are listed below; each one moves at least one column of the readiness matrix.
- 3. Gaps.** The verified assessment records **4** (5.12, 6.3, 8.11, 8.17). The shadow run records **22**, of which it found **4** of the recorded ones and raised **18** the verified assessment does not carry. It also set **7** ratification holds against the verified assessment's 7.
- 4. The rural/national trap at 2.1. Avoided.** The shadow run recorded 2.1 as Gap with no level; gate verdict gap. It did not record a national coverage figure against an indicator naming rural coverage — the error that passed an assessor gate and an initial peer review before an audit caught it.

This country's verified assessment records 2.1 as Documented at L3 on a T4 source, so the two differ — avoiding the trap and matching the verified conclusion are separate questions.

The verified level here could not have been reproduced at any depth of searching. It rests on a T4 source, and decision C4 requires T1–T3 quote-verified evidence for a prerequisite. The bar would have withheld this level even had the pipeline found the same document. That is a fact about the rule rather than about the run, and it is a genuine question for the §13 rulings: either the bar is right and this row should read Unverified, or the bar is too high for an indicator whose only published estimate is modelled.

On the construct: *The indicator names RURAL mobile broadband coverage. The best T1 evidence in the supplied pages is national: ITU's Nigeria dashboard reports population covered by at least a 3G mobile network (2022) at 87% and population covered by at least a 4G mobile network (2022) at 81%, plus mobile-cellular network coverage of 94%. These are whole-population figures with no urban/rural split, so they cannot ...*

Recorded value: DATA GAP – 1) ITU Digital Development Dashboard for Nigeria (ddd_NGA.pdf, T1) – found national coverage: 94% mobile-cellular, 87% at-least-3G, 81% at-least-4G (2022); the only rural-tagged row is households with Internet access at home, rural (2017) 2%, a different construct. No rural coverage spli...

- 5. Cost and time. \$21.47** across 1616 vendor calls in 37 minutes, against a \$500 country ceiling — 4.3% of it, across 2 passes (NGA_shadow, NGA_shadow_g2). By vendor: anthropic \$11.39, openai \$3.70, perplexity \$3.54, exa \$1.90, jina \$0.95.

Pillars

pillar	verified mean (band)	rated/held	shadow mean (band)	rated/held
A1	2.25 (Emerging)	8/2	2.33 (Emerging)	6/0
C1	2.83 (Established)	6/0	3.0 (Established)	3/1
C2	2.57 (Emerging)	7/1	2.8 (Established)	5/2
C3	2.88 (Established)	8/0	2.75 (Established)	4/0
C4	2.5 (Emerging)	4/2	3.0 (Established)	2/1
E1	2.56 (Emerging)	9/1	3.0 (Established)	6/3
O1	3.25 (Established)	4/1	3.5 (Advanced)	2/0

Which direction the divergences run

This is the part to read first. A shadow run that withholds a level where the verified assessment set one costs coverage; a shadow run that sets a level *higher* than the verified assessment is claiming readiness the evidence may not carry, and that is the failure that matters.

- **4 rows read higher** than the verified assessment.
 - **4.9 Inter-ministerial coordination mechanism** — L1 to L3. The National Authority organizes meetings of the Inter-Ministerial Committee on Chemical and Biological Weapons Conventions quarterly or bi-annually, and its membership includes the Federal Ministry ...
 - **6.4 Agtech venture ecosystem** — L3 to L4. Nigeria has an operating agritech venture ecosystem of digital solution providers for smallholder farmers, supported by incubators, accelerators, angel investors and donors, but only a handful of sta...
 - **7.2 AI-enabled agricultural solutions deployed** — L2 to L3. FAO's Science, Technology and Innovation Portal records the AKILIMO Nigeria Integrated Digital Agronomic Solution — classified as an artificial intelligence (AI) digital technology — as adopted in Ni...
 - **8.12 Documented impact evidence (yield/income)** — L3 to L4. A randomized controlled trial of the RiceAdvice digital personalized-extension app in Nigeria found that farm households receiving personalized advice increased their yield by 7% and their profit by ...
- **3 rows read lower.** 1.5 (L3 → L1), 3.6 (L4 → L3), 4.1 (L4 → L3)
- **19 rows withheld a level** the verified assessment set: 1.1, 1.6, 1.7, 2.1, 2.7, 2.11, 3.4, 3.11, 4.2, 4.3, 4.5, 4.7, 5.7, 5.8, 6.9, 6.12, 6.14, 8.4, 8.6.
- **1 row set a level** the verified assessment withheld: 8.5.

The asymmetry between the last two is the abstention threshold, stated as a number. It is the figure to tune, and tuning it in either direction moves the first bullet — which is the one that decides whether a machine-set readiness matrix can be trusted.

Where the shadow run withheld a level

Each gate below is a design decision doing its job. A row that reaches a gate keeps its evidence; what it loses is the level, and with it its place in every mean.

gate	rows
construct (hold)	5
tier (hold)	1
coherence (hold)	1

Independent corroboration

11 rows are also covered by a machine-fetchable T1 series, fetched separately and never substituted for the research lane's own answer. **7 of 11** research values agree with the independent series within 2%.

Reading this

Divergence here is the expected result. The verified assessments came from sustained human-directed searching under the full tiered protocol — Nigeria went from 21 recorded gaps to 4 that way — and this pass runs once, on a budget, without the Gate 2 refutation round that found four of those gap refutations. More gaps and more holds are the honest output of a first automated pass, not a regression.

The number to act on is the **abstention rate**: 7 holds and 22 gaps against the verified 7 and 4. Too loose and everything reads Ready; too tight and everything reads Unverified. These figures are what that threshold should be tuned against, and they should be kept — when automated Gate 2 arrives, re-running this comparison is what tells you whether it earns its 15% of the budget.
